

AV

## Corporate Project Experience

The Client is a professional services company working across a number of diverse work streams. For this reason, they have a significant number of internal users with varying requirements. The company urgently required a design document to standardise the deployment for AV equipment across their UK offices.

Hewshott was tasked with developing a set of room standards that would meet the requirements of the highest possible number of users whilst also providing a flexible platform on top of which custom spaces could be delivered throughout the estate.

Through a combination of AV over fibre infrastructure, server-based DSP solutions and centralised control systems, we developed a technology framework, in conjunction with the client team, that ticked all of these boxes. Hewshott also devised the design document so that it could be revisited and updated as the business or technology requirements shifted in the future.

Alongside the meeting room standards, we utilised a third-party control system programmer to develop a bespoke graphical user interface (GUI) to be rolled out across all sites and a centralised remote monitoring and management platform which is now heavily utilised by the service and maintenance teams.

Hewshott was invited back to consultant on various other AV projects for the company.
